Caribou knives with the **ULTRAGRIP** handle benefit people in the food industry by improving the grip when wearing cut-resistant gloves and thus reducing injuries.

One of the most feared injuries in the meat industry is a **“run-on”**. This happens when the knife, while being pushed forwards, stops unexpectedly (hitting a bone or other solid object). The hand holding the knife slips off the handle onto the blade, resulting in severe injuries such as severed tendons.

Even when wearing a cut-resistant glove, the same danger exists. The injury will be less severe due to the protection offered by the glove, but the **likelihood** is actually increased, because these gloves are more slippery than naked skin. These gloves are made from high-performance fibres which are very effective in preventing these slash-type injuries. Unfortunately these very tough fibres can be quite slippery so the knife has to be tightly gripped.

To counter this we provide a unique solution - the **ULTRAGRIP** handle. The ULTRAGRIP handle has miniature pegs which are shaped to interlock with the weave of the glove, keeping the position of the knife in the hand absolutely constant without excessive muscular strain.

See over for codes and descriptions.

Caribou Knives

Other benefits include:

- ✓ Optional fluted sides to the blade (Code -23-) create an air cushion which reduces the suction of the meat for less effort and muscular strain.
